EDUCATION

Georgia Institute of Technology

Aug 2025 – May 2027

Master of Science in Computational Science and Engineering

Atlanta, GA

- GPA: 3.87/4.00

South China University of Technology

Sep 2021 – Jul 2025

Bachelor of Engineering in Software Engineering

Guangzhou, China

- GPA: 3.72/4.00
- Graduated with Dean's List, Second-class Scholarship for Excellent Students for 3 Years (**top 10%**)

SKILLS

Programming Languages: Python, Java, HTML/CSS/JavaScript, C/C++, SQL, Rust, Dart, Ruby

Frameworks: LangChain, PyTorch, Scikit-learn, Spring Boot, Spring Cloud, React.js, Vue.js, CMake

Tools: MySQL, PostgreSQL, MongoDB, Redis, Git, Docker, Linux, AWS, RocketMQ, Spark, Hadoop

PROFESSIONAL EXPERIENCE

Amazon Web Services

May 2026 – Aug 2026

Software Engineer Intern

Palo Alto, CA

- Delivered the **Python extended client** of the Data Plane Proxy Service end-to-end, covering authentication, credential provisioning, exception classification, and CloudWatch metrics, to unblock Python-based RDS control-plane teams; hardened it with a **Hydra integration-test suite** wired into the pre-prod/prod pipeline.
- Built an **onboarding agent** for the Data Plane Proxy Service that generates validated CDK code, tests, and a code review from a single ticket, and lets customers track onboarding status and self-diagnose errors; onboarded 10+ control-plane teams, cutting onboarding from days to hours and reducing support load on the team.
- Expanded **load test infrastructure** with a Production Mock Test tier covering real production scenarios: slow responses from downstream causing thread starvation, high query-argument counts, and large response bodies.

Meituan

Apr 2025 – Jun 2025

Software Engineer Intern

Beijing, China

- Integrated **LangChain** with a **RAG** pipeline using hybrid FAISS+BM25 for an AI **Agent** development, supporting automatic driving platform and offering daily data analysis for product operations team.
- Implemented the agent search interface with a **full-stack** architecture (**Vue.js+Python Flask+Supabase**), and deployed this interface as a **MCP** tool to make this agent interface easy to deploy and use.
- Optimized Webviz proto decoding by implementing **Rust**-based WebAssembly modules executed in Web Workers, achieving up to 9× performance improvement over previous JavaScript solution.

Momenta

Jan 2025 – Mar 2025

Software Engineer Intern

Beijing, China

- Built a high-performance **C** SDK with multi-threaded file download (1 GB/s, 1.7 GB memory for 10 GB files) and raw-bag + refresh-topic merging, cutting storage overhead by eliminating redundant full-bag generation.
- Enabled **JavaScript-C cross-compilation** and packaged C code as an npm module used in **Node.js**, ensuring compatibility across Linux, macOS, and user **Docker** images, serving 500+ colleagues.
- Resolved topic version mismatches in ROS(Robot Operating System) .bag files by developing an algorithm to accurately identify versions, enabling automated classification of 2 million internal data entries.

National University of Singapore Research Institute

Sep 2024 – Dec 2024

Software Engineer Intern

Chongqing, China

- Built scalable **Microservice** architecture using **Spring Cloud** for a shopping management system, and developed 20+ **RESTful APIs**. Implemented fuzzy search on store names using **Elasticsearch**.
- Optimized system performance by 65% through strategic **Redis** caching implementation for high-frequency operations. Implemented distributed ID generation using Redis INCR operations to ensure scalability.
- Built a monitoring dashboard for multidimensional KPI tracking, reducing query latency from 1800 ms to 20 ms (90× faster) through **SQL** aggregation optimization and indexing.

PROJECT EXPERIENCE

Short URL Platform | *Spring Boot, MySQL, Redis, RocketMQ, ShardingSphere, Sentinel*

- Implemented database sharding with **ShardingSphere** to store short link and user data at different data tables.
- Utilized **Redis Streams** with **Redisson** to asynchronously process short link analytics events.
- Built and optimized a **CI/CD** pipeline via GitHub Actions, enforcing automated testing.
- Deployed the short URL platform on **AWS** (EC2, RDS, S3), achieving **scalable** infrastructure.
